Supported contact types Include:

- Inbound and outbound voice
- Email
- Text (SMS)
- Web chat
- Instant Messaging
- Voice Messaging
- Fax or scanned documents
- Social Media

Avaya Aura® Contact Center – Power Up Your Contact Center with Multimedia

Connect with Customers on Their Terms

Today’s consumers are more wired and technically savvy than ever before, with email, social media and the web serving as primary sources of information. Businesses wanting to gain a competitive edge with these customers know that a contact center must do more than simply manage customer service calls.

With studies showing that voice interactions are declining while text and other types of interactions are on the rise, many businesses are acting on these changing dynamics by adding new channels to their contact center.¹

Avaya can help your business communicate with customers on their own terms by enabling you to communicate with them in almost any way they choose. With Avaya solutions, emails and web chats can be handled with the same level of care applied to voice interactions. And, using a single desktop interface, agents can manage different modes of customer contact as a single, very effective work flow that makes agents more productive.

This unified approach enhances the customer experience, moving it beyond mere ‘satisfaction’ to new levels of brand and customer loyalty.

Managing Text Based Customer Interactions

A major differentiator for businesses today, the Avaya Aura® Contact Center multimedia solution enables a business to contextually route incoming text-based contacts in the same way inbound voice calls are routed. Using our solution, customers can choose to make contact via email, text, or by filling in a form on your corporate website using their preferred device.

2013 Channel Preferences

Web Chat, Social, & Video Are on the Rise

“Avaya’s next generation contact center clearly is oriented to making the most of agents’ time and productivity.”¹

— Edwin E. Mier, CEO of MierConsulting, LLC

The Avaya Aura Contact Center multimedia server picks up these text-based messages and routes them based on business rules you define. Rules can be based on the “To:” address, key words found in the subject line or body of the email, or other customer data such as information in your corporate CRM system.

When an agent responds to an email, the continuing exchange is captured and stored so context and continuity are retained. In addition, an email thread, dialog represented by a series of individual email messages, can be used to send a given email to the same agent who handled it previously.

Providing personalized service like this makes customers feel valued and can boost long term loyalty to your business and your brand.

Emails are saved as part of the customer contact history and can be accessed easily via the intuitive Agent Desktop interface through which agents can view contact history by selecting an individual contact. This sequential record gives agents a holistic perspective of a customer’s experience, making interactions with customers more efficient and personalized.

Make the Most of your Customer’s Web Experience

A web site is one of the most important marketing tools a business has. Typically requiring a large investment in time and money, your web site should be working hard to provide the kind of high-quality customer experience that drives revenue.

With Avaya Aura Contact Center, customers on your web site can click-to-talk to an agent or text chat directly with an agent. Convenient communication like this helps customers resolve purchase-inhibiting issues quickly, getting them one step closer to making a purchase.

Web Chat

Let’s say Bob Smith, potential repeat customer, is looking through your product pages and can’t find specifications on a product he purchased two years ago. Bob selects the option to chat with a customer service representative. His request is routed to Courtney who opens a text chat with Bob.

Web on Hold

While Avaya Aura Contact Center is routing the chat request, Bob can be sent static or video content. This enhances Bob’s experience and enables your business to provide useful information to him as he waits for the web chat to begin.

Web Browsing

From the text chat discussion, Courtney determines exactly what Bob needs. She selects a web page and pushes it to Bob’s computer screen. Bob pushes pages back to Courtney and, as their session progresses, Bob gets all the information he needs.

“A super feature is the full transaction history – of all multimedia contact types – associated with a customer, which is permanently retained within the system.”¹

Pre-defined Responses and Auto Suggest

When replying to Bob, Courtney can also use pre-defined templates, the address book, or the popular auto-suggest feature.

Call Back Request

If Bob had preferred the more personal touch of voice contact, he could have been given the option to schedule an immediate or future call back to discuss his needs with Courtney.

Web Forms

Had Courtney required more information from Bob, she could have pushed a forms page or document that Bob could fill in and email. Web forms are commonly used for verification, surveys or simple data collection.

Bob’s web experience has been fast and efficient. Your web site played a major role in giving Bob exactly what he wanted, keeping your customer happy and increasing the odds that he’ll return.

Social Media Responses

The popularity of social networking sites such as Twitter and Facebook are forcing businesses to take an in-depth look at the impact of social media and how to use it to their advantage. The Avaya Social Media Analytics cloud solution analyzes and categorizes social media and can post and route it into Avaya Aura Contact Center where it can be handled by an agent. Effective management of social media gives businesses a powerful competitive edge in finding and leveraging new business

opportunities and can transform a potentially bad customer experience into a glowing testimonial.

Boost Agent Productivity

Avaya Aura® Agent Desktop, a powerful agent interface, presents current and historical customer contact information to agents including email, web chat, and inbound and outbound voice. It presents outbound campaign scripts and collects data about contacts, which is retained in the system for future use. It is the only tool an agent needs to receive and/or initiate a voice or text contact and, because it saves all contacts, it creates a complete history of a customer's interactions.

The ability to handle multiple contacts simultaneously is important to both agents and supervisors. If an agent is handling a web chat when the customer unexpectedly steps away and is no longer responding, instead of wasting time waiting for the customer to continue the web chat, the agent can accept another incoming customer interaction. With Avaya Aura Contact Center, agents can support up to six contacts simultaneously - one voice and five text-based contacts.

For voice interactions, the Avaya Aura Agent Desktop interface includes an embedded softphone, or it can also be used with a variety of Avaya desk phones. The Avaya Aura Agent Desktop interface is a simple plug-in deployed using .NET smart technology. The client software is accessed easily through a short cut on the agent desktop.

“Avaya Aura Contact Center raises the bar in the integration of multiple channels. It offers one of the most effective agent interfaces we have seen in recent years for cleanly blending a mix of voice calls and text-based contacts.”¹

— Edwin E. Mier, CEO of MierConsulting, LLC

“We are impressed with the built-in ability of the contact center to automatically respond or suggest email replies based on key words in customers' email messages.”¹

— Edwin E. Mier, CEO of MierConsulting, LLC

Proactive Customer Engagement

Avaya Aura® Contact Center allows customers to seamlessly unify agent-based predictive, progressive, and preview dialing for a simple, fully-integrated, outbound engagement solution. With sophisticated outbound dialing modes the solution lets you choose the way you want to work while optimizing agent productivity and live party connections. For example, agents can be configured to support inbound, outbound, and multimedia interactions based upon pre-defined thresholds. This advanced blending helps maximize the use of agent's time during periods of low inbound call volume.

How does it work? In preview mode (Manual Agent Dial mode), the agent is presented with a customer record before the call is placed, affording them some time to review the data before being connected to the customer. The agent controls when the call is placed and has the option to skip the call should they desire. In progressive mode (Auto Dial mode), the call is placed automatically; the agent cannot choose to skip the call. The auto dial can be immediate, or delayed up to a maximum of 999 seconds after the transaction has been presented.

Predictive dialing, through integration with Avaya Proactive Outreach Manager, uses statistical algorithms to minimize the time that agents spend waiting between conversations and calls being answered. The result is that it eliminates delays such as the dialing time, when we know that statistically only a fraction of dials are answered, and the time it takes before a call is picked up by a live person. Predictive dialing is by far the most advanced and time efficient form of outbound dialing, especially when seamlessly blended with inbound contact handling.

Avaya Aura Contact Center and the advanced integration with Proactive Outreach Manager offers detailed management of blending criteria. For example, when inbound contact volumes drop the system can be configured to automatically convert agents to outbound predictive dialing to maximize productivity. Alternatively, when inbound contact volume rises or if service levels are not being met, agents will automatically be converted back to handling inbound contacts only.

Deployment Options

Avaya Aura Contact Center multimedia capabilities can be deployed on a per agent basis, and are available in the following configuration options:

- Fully blended voice and multimedia - Avaya Aura Contact Center deployed with full voice and multimedia contact types.
- As a standalone multimedia system - For customers not wanting to support voice interactions or who use another system for voice-based customer service.

Contact Center Reporting

Reporting capabilities are the heart of every contact center and Avaya offers one of the most powerful, easy-to-use reporting solutions in the industry. Reports can include all types of contacts, detailed or summarized, by agent, skillset or contact center. There are over 110 different standard reports and a Report Creation Wizard.

The Report Creation Wizard is tightly integrated into core elements of the Avaya Aura® Contact Center solution, including multimedia functionality. Therefore, custom reports can include information on all types of media contacts. You can tailor reports to provide specific criteria required by your organization while continually analyzing results, uncovering areas of opportunity or areas in need of improvement.

Driving Loyalty

Avaya Aura Contact Center enables you to give your customers a multimedia experience that can drive long-term loyalty and help capture more revenue. Our solution helps your customers get what they want when they want it—a true formula for success!
